CS 470 Final Reflection

<https://youtu.be/x7xyq6bnPc4>

In this week's assignment im being asked to write about what I learned through this course and how it will affect me into my professional career. To be honest I learned quite a bit about AWS serverless cloud management and how to create API's to optimally run a back end of a website. There were a couple bumps along the way of course but ultimately, I enjoyed. I'm not the strongest coder, aka im not good at all, and it really frustrated me early into my college experience, so I switched my concentration to project management. My skills as a developer are pretty much as bare as you could get. I lost interest in development/programming halfway through to be honest. I still find it interesting, but I would have to be in the right situation to learn it again and continue to grow with it.

I do think this class will offer some beneficial to my career choice as I now have a better understanding of full stack and if I go into project management for an IT department or what not then I would at least know what I'm looking at and how it can all be managed. When it comes to the scalability and cost of a project you can just break it down into the factors of man power, size of the company, what the project is trying to accomplish and so on. Looking into the analytics of how it can compete within the industry and the pay for service plan can help lead a company into making smarter business decisions down the road.
